

OSINT Investigation Report

Objective

To conduct an Open Source Intelligence (OSINT) investigation using publicly available information in a safe and ethical manner.

Introduction

OSINT is the process of collecting and analyzing information from publicly accessible sources such as search engines, WHOIS records, DNS records, and other openly available resources. This investigation was performed for educational purposes only.

Tools Used

Google Search, Google Dorking, WHOIS Lookup, nslookup, dig, theHarvester (optional), Shodan (optional).

Methodology

1. Selected a practice target (example.com). 2. Performed search engine queries. 3. Collected WHOIS and DNS information. 4. Reviewed publicly available data. 5. Documented findings.

Sample Findings

The investigation identified publicly available domain registration details, DNS records, and general website information. No unauthorized access or intrusive techniques were used. Public information can reveal infrastructure details that organizations should periodically review.

Recommendations

Limit unnecessary public exposure, regularly review DNS records, secure exposed documents, monitor public information, and follow responsible disclosure practices.

Conclusion

This exercise demonstrated how OSINT techniques can help security professionals understand an organization's digital footprint using only publicly available information. Ethical and legal boundaries were respected throughout the investigation.
